PHYSICAL LAYER

Social Network Analysis

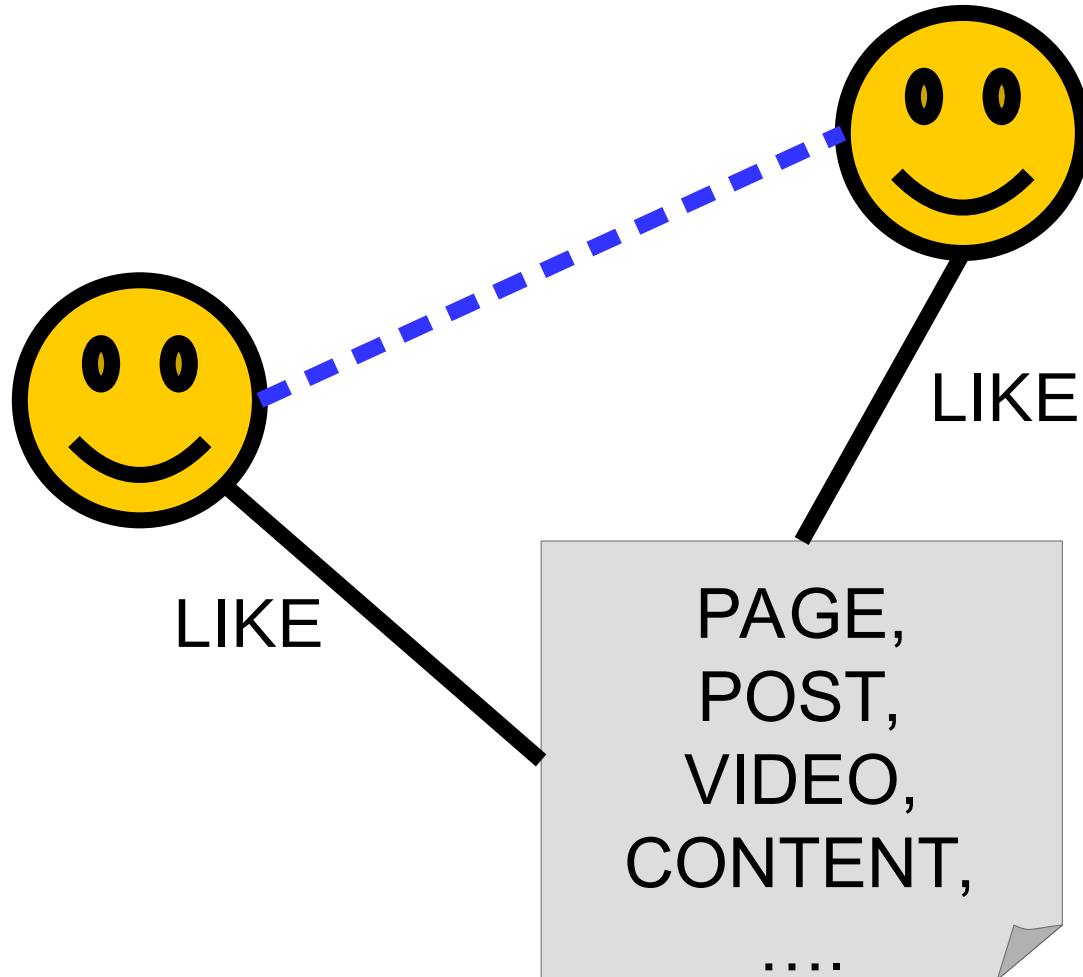

- 1930s : Jacob Moreno and Helen Jennings introduced basic analytical methods.
- 1954: John Arundel Barnes started using the term systematically to denote the patterns of ties defining bounded groups (e.g., tribes, families) and social categories (e.g., gender, ethnicity)

I ¹ really enjoyed using the ¹ Canon Ixus in Madrid on March 4. The ² Panasonic Lumix ² is a bit disappointing, but the ³ Canon ³ camera is ³ not bad at all. All I want when taking photos is point it and then just press the button. For only 200 dollars, a ⁴ really fair ⁴ price, this ⁵ camera is ⁵ perfect for me. Besides, I have had a ⁶ good ⁶ customer ⁶ service ⁶ experience. ⁷ John Faraday was ⁷ very nice!

1st Generation: the power of traditional mass media

One-to-many: a "big" node covers many "small" nodes.

Top-down unidirectional connections (*broadcasting*)

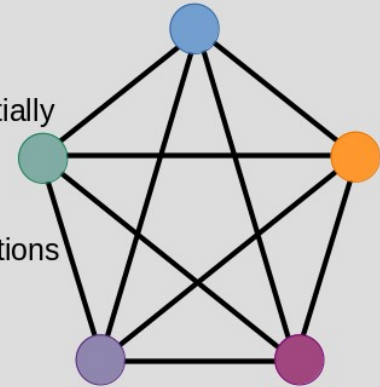

Linear growth of the network value (Sarnoff)

2nd Generation: the power of Telcos is tied to network externalities

Peer-to-peer: all the "small" nodes can potentially communicate among themselves

p2p bidirectional connections (telecommunications)

Quadratic growth of the network value (Metcalfe)

3rd Generation: the explosive power of online platforms

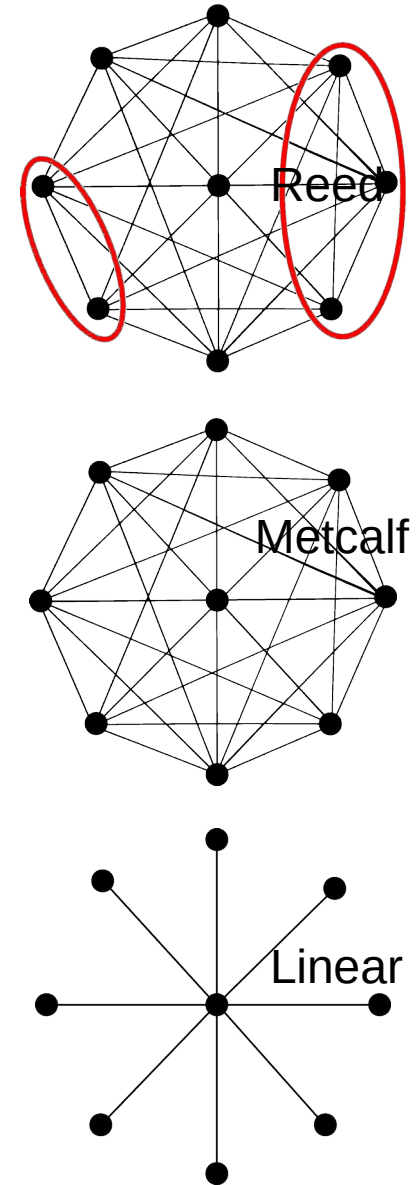

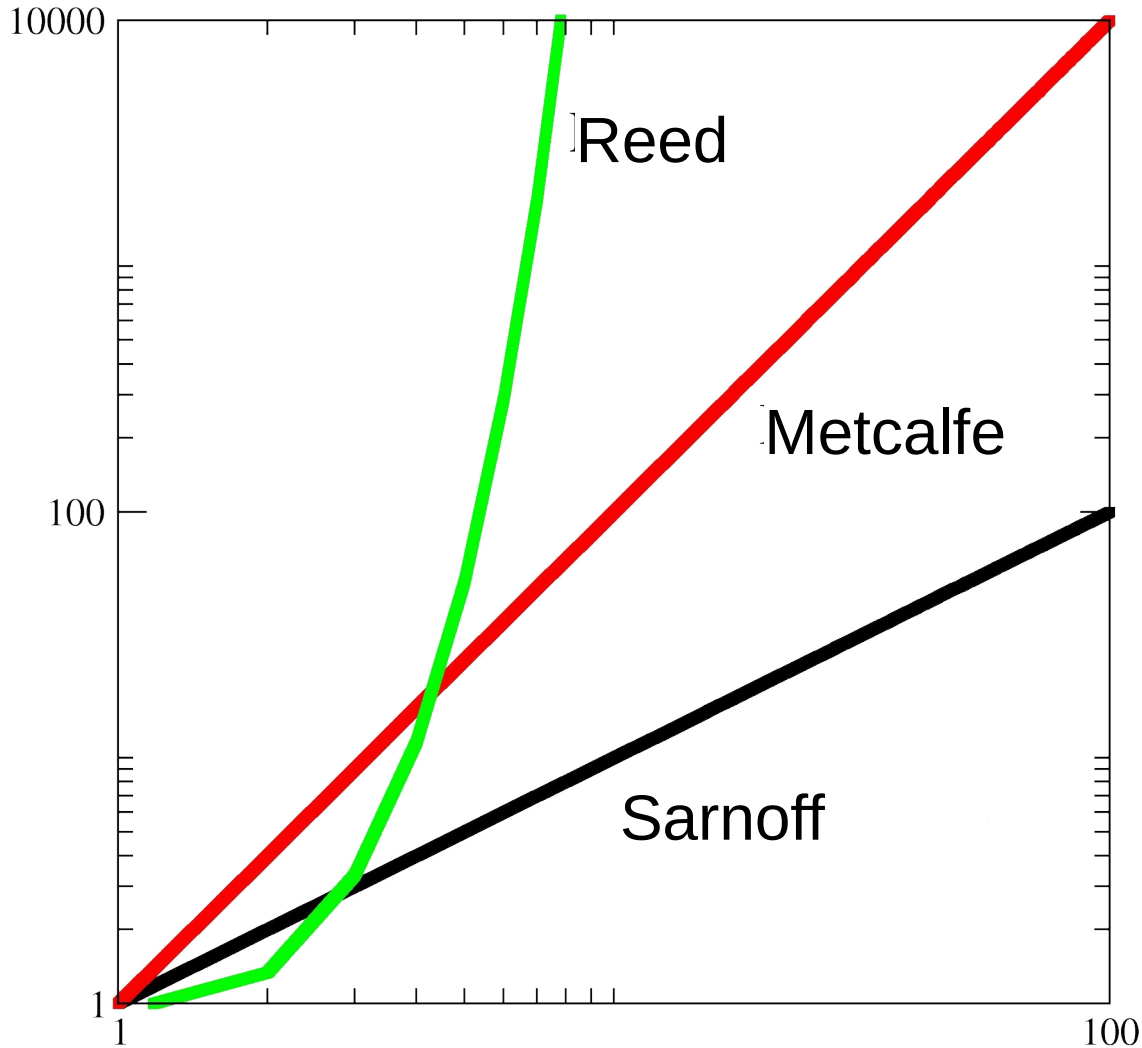

Group-Forming Networks : "small" nodes are clustered, also by means of personalized algorithms, and may be targeted and/or sold

GFNs (e.g., social networks) with multiple connections and bidirectionality

Quasi-exponential growth of the network value (Nivi, Reed)

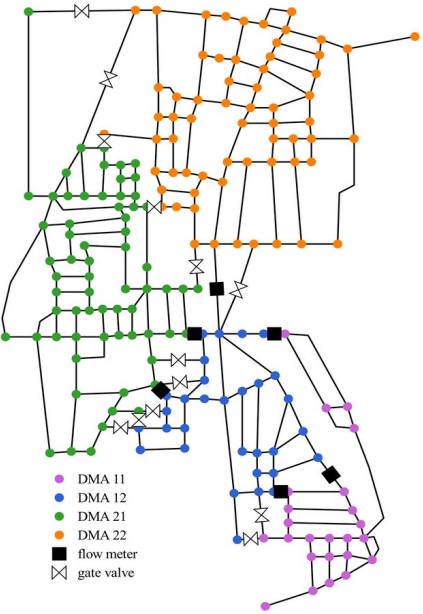

Network economy

Networks & the construction of the reality

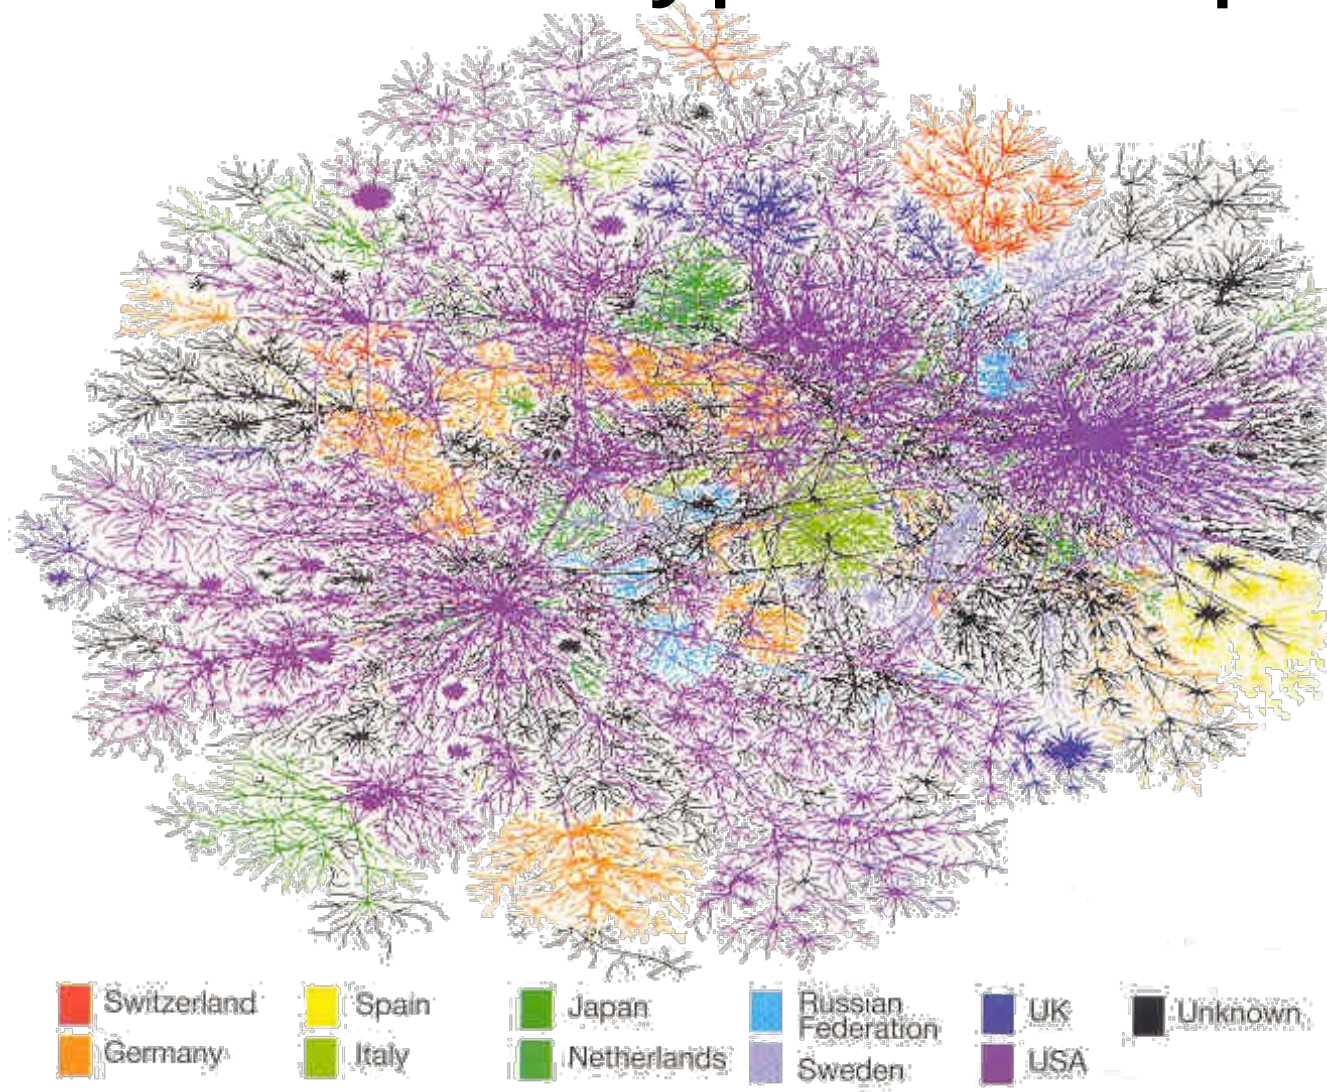

Our space is two-dimensional

Manhattan distance

Internet is an hyperbolic space

consequences: “small world”

Search Engines & Knowledge Networks

"The most frequently discussed search engine problem is the data glut generated by automated engines. These typically generate concordances on far more links than the user has time to process, with little or no indication as to the nature of the pages and, hence, their suitability."

"Networks, Noise and Web Navigation: Sustaining Metcalfe's Law through Technological Innovation"

Paul Windrum and G. M. Peter Swann, 1999

Hyperbolic spaces & algorithmic biases

Della natura non-euclidea dei big data su internet e sulle sue conseguenze
Antonio Scala, Scienza & Filosofia 20, 2018

Ramanujan & the starred sky

Ramanujan theorem → chaos contains ordered regions

Cognitive biases → automatic search for patterns

can find order even when it is absent

can build up multiple realities

Algorithmic limits 1: Goedel's theorem

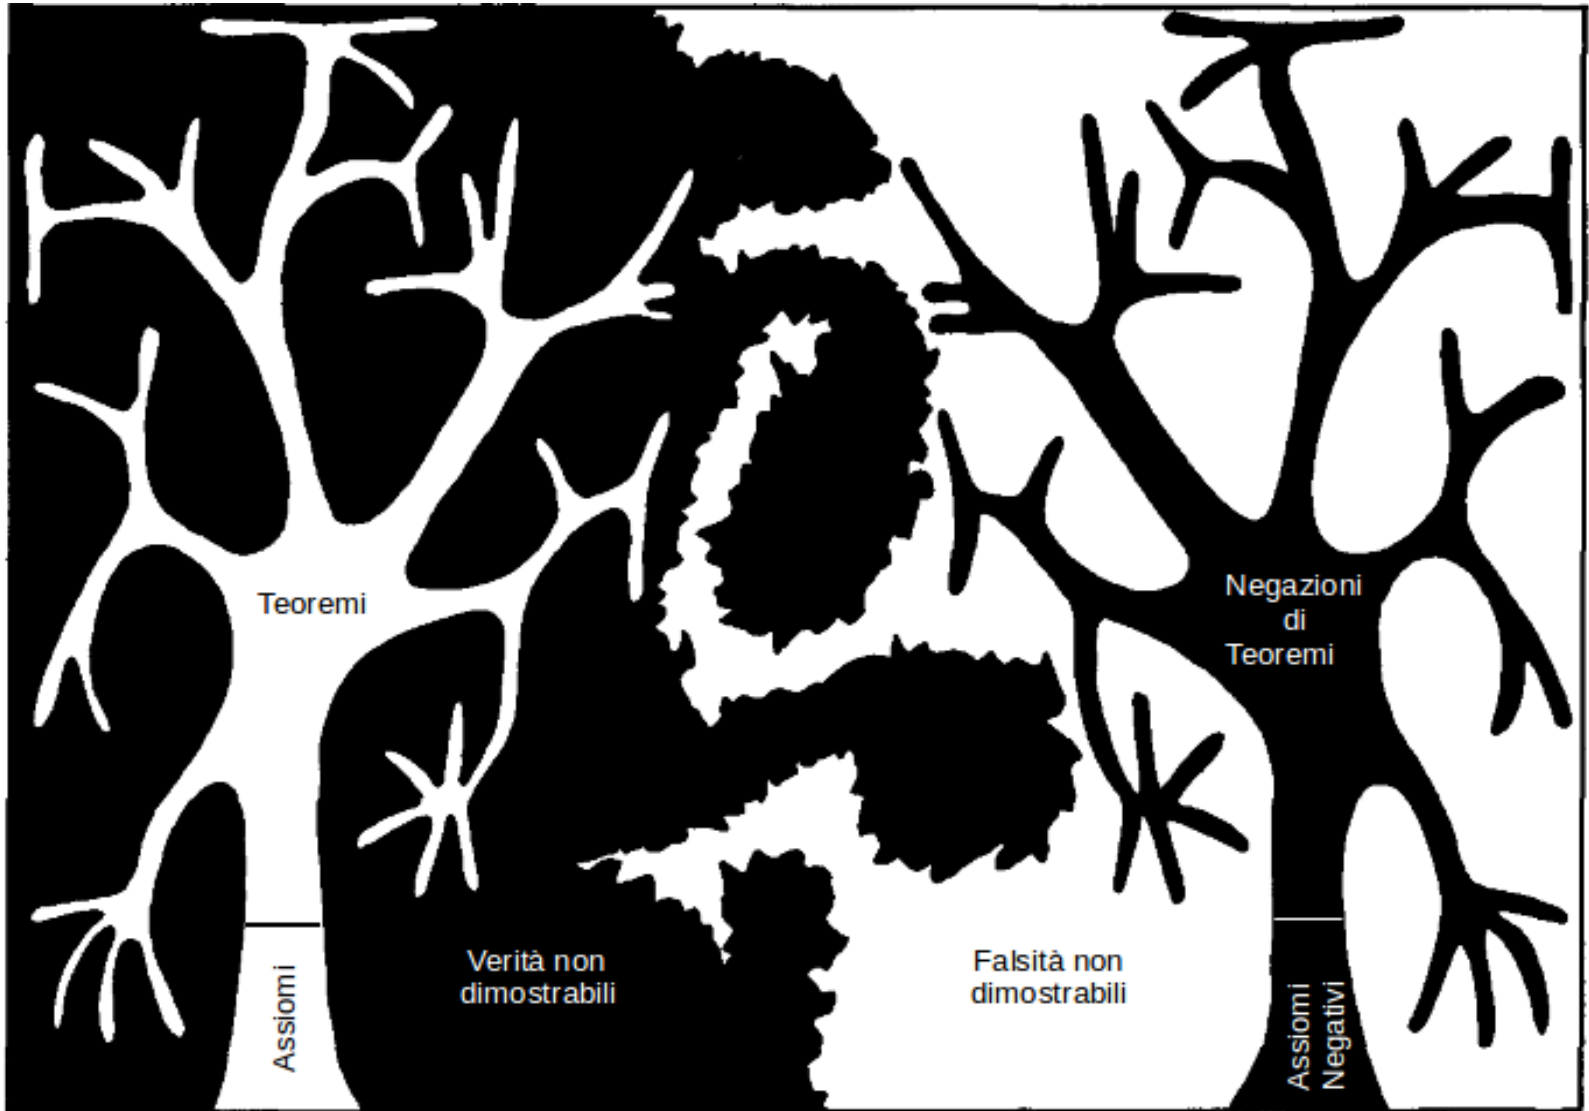

Figura tratta da: Douglas R. Hofstadter " Gödel, Escher, Bach. Un'eterna ghirlanda brillante"

Algorithmic limits 2: Teorema di Arrow

Arrow's theorem: there is no algorithm that uniquely identifies the general interest of a community starting from individual preferences

- UNIVERSALITY: leads always to a decision
- PEOPLE SOVEREIGNTY: every choice can be selected via an appropriate set of individual preferences
- NON DICTATORSHIP: no individual or small group can decide the collective choice regardless to other's preferences
- UNANIMITY: If everyone prefers A to B, then A must be selected
- INDEPENDENCE FROM IRRELEVANT ALTERNATIVES: the result does not change by taking away alternatives that have not been selected

Algorithmic limits 3

Sen's Paradox

No algorithm that aggregates individual preferences can simultaneously satisfy the following conditions:

- **UNIVERSALITY:** all preferences are admitted
- **Pareto:** If everyone strictly prefers A to B, the algorithm does not choose B
- **LIBERALISM:** for some issues, if an individual prefers A to B, society respects his preference even if everyone else is against it

Gibbard-Satterthwaite's theorem

Given a deterministic ordinal algorithm that picks a single winner, one of the following holds:

- The rule is dictatorial, i.e. there is a voter who can choose the winner
- The rule limits the possible outcomes to only two alternatives
- The rule is amenable to tactical voting: under certain conditions, a voter's sincere vote may not best defend his or her opinion

Echo chambers

Polarization & echo chambers

Activism & Reinforcement

Science vs conspiracy: Collective narratives in the age of misinformation
A Bessi, M Coletto, G A Davidescu, A Scala, G Caldarelli, W Quattrociocchi

MEME
~ 10 AM

COUNTER-MEME
~ 13:00

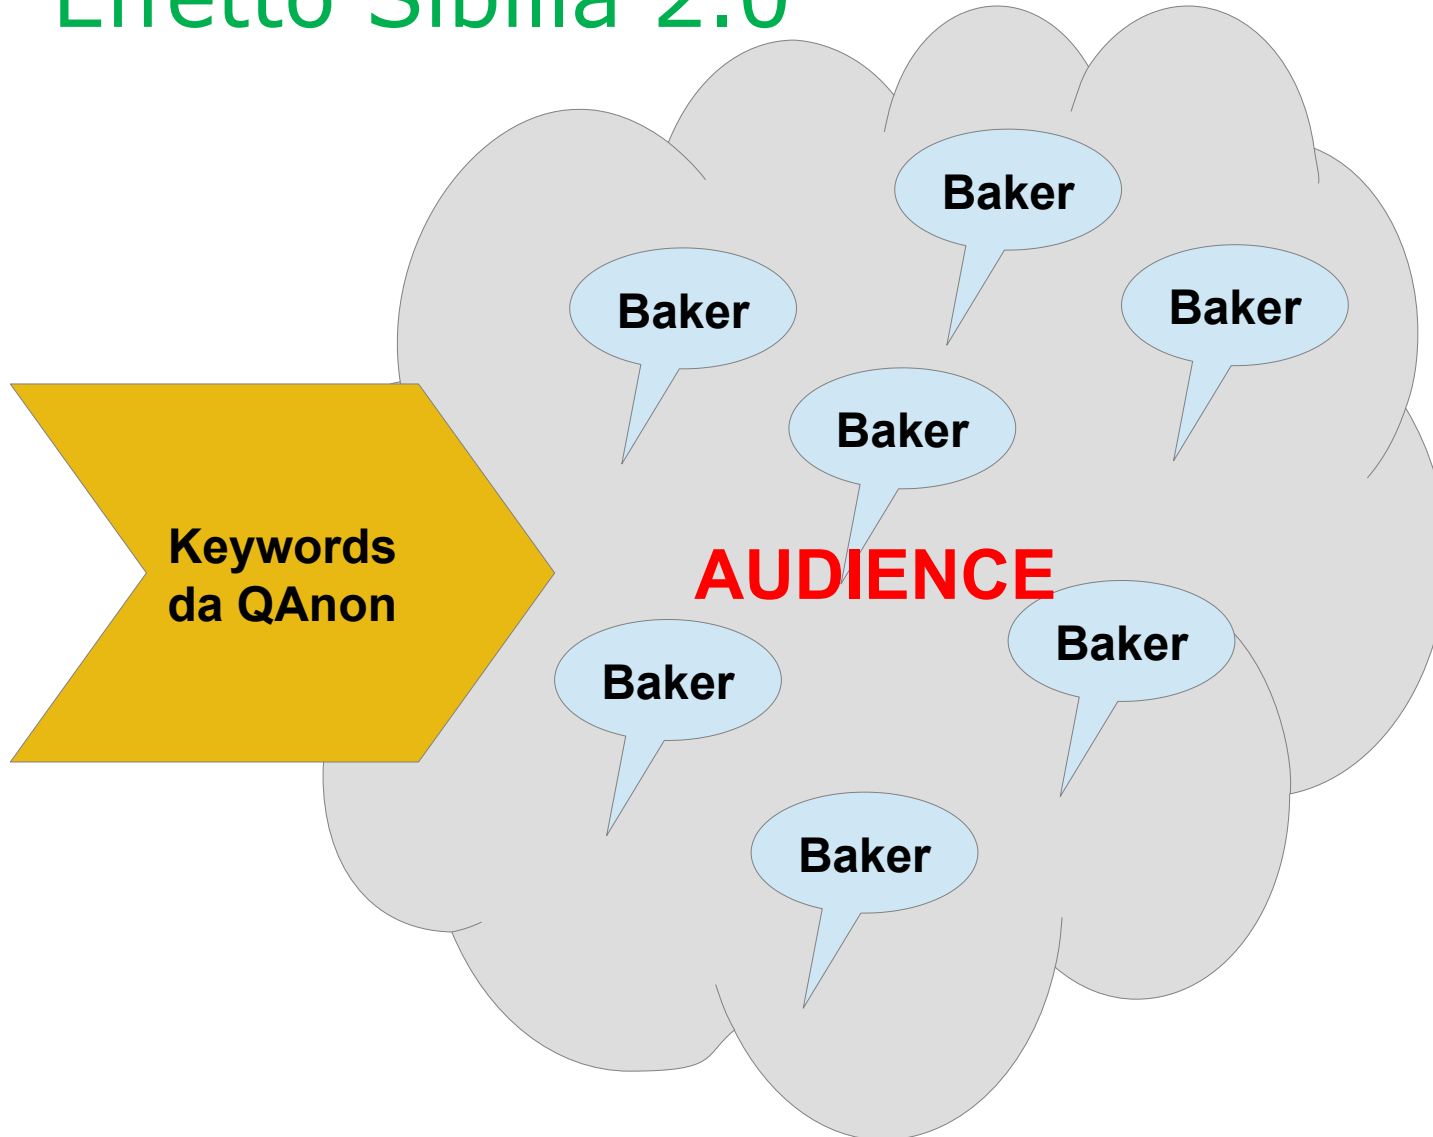

~ 3 HOURS TO DELIVER

A line graph with a blue line on a light gray background. The line starts at a low point on the left, rises to a peak, falls to a trough, rises to a second peak, and then falls again. The first peak is labeled 'MEME ~ 10 AM' in red text. The second peak is labeled 'COUNTER-MEME ~ 13:00' in green text. Below the line, a large double-headed arrow spans the distance between the two peaks, with the text '~ 3 HOURS TO DELIVER' inside it.

Structure of the media vs information flux

- Wikipedia:
 - Social control
 - HierarchyWORKS ! (almost ...)
- Facebook:
 - “Politically correct”
 - EguaritarismoMISINFORMATION !

An unstructured information medium creates problems for the verificabilità dell'informazione

SUMMARY

- The structure of the cyberspace defies human experience and perception
- Algorithms cannot be avoided but influence the construction of the reality
- Social media induce echo-chambers (small-world + algorithms + biases)
- Echo chambers = Tribes + Irrationality (as usual for human beings)

Advertising & Conflict of interest

END OF DEMOCRACY

Thanks!

Polarization

- Le notizie nei social networks non diffondono in un substrato omogeneo, ma rimangono intrappolate all'interno di comunità di utenti polarizzati
- Le comunità rispondono in maniera diversa alle stesse notizie

Inoculazione di notizie

- Paradigma classico

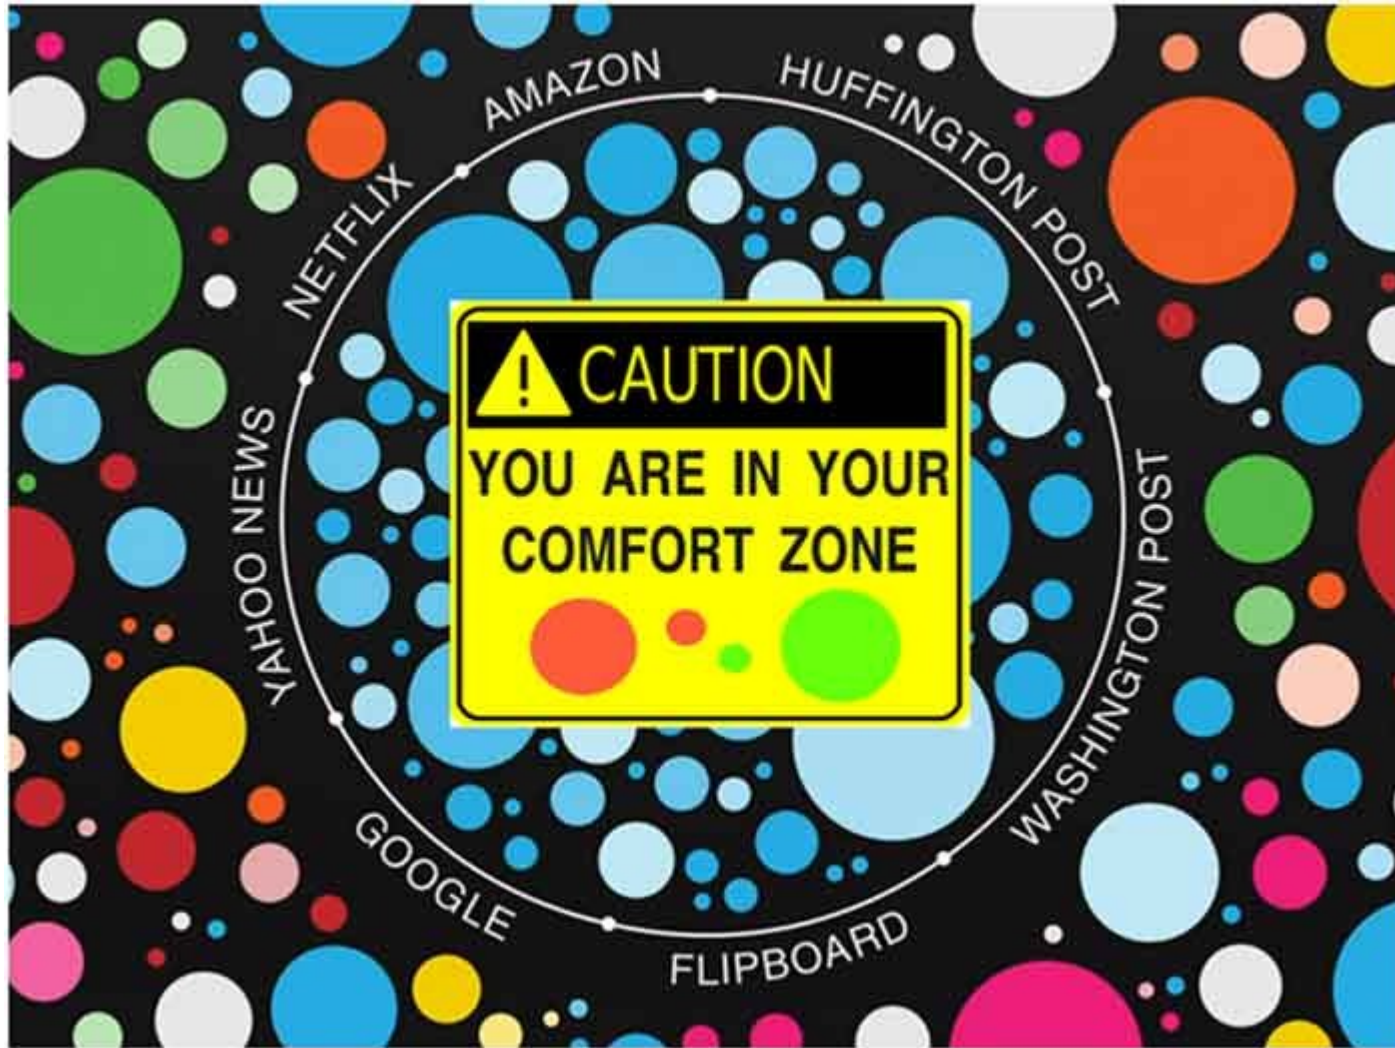

- Effetti di polarizzazione nei social media

Recap:

- Le reti rappresentano un nuovo spazio niente affatto virtuale
- La struttura delle reti è “iperbolica”, ovvero non è uno spazio in cui gli esseri umani si sono evoluti
- Senza bias algoritmici le reti non sono esplorabili
- Non esistono algoritmi in grado di confermare la verità o la falsità di una proposizione
- Non esistono algoritmi che permettano di passare univocamente (e “ragionevolmente”) dalle preferenze individuali ad una scelta collettiva

Echo chambers

ECHO CHAMBER

n ('ɛkəʊ ,tʃeɪmbə)

An environment, especially on a social media site, in which any statement of opinion is likely to be greeted with approval because it will only be read or heard by people who hold similar views.

Echo chambers
