## Session 5 - Overview of methods for mapping and assessment of ES

Dr. Blal Adem Esmail

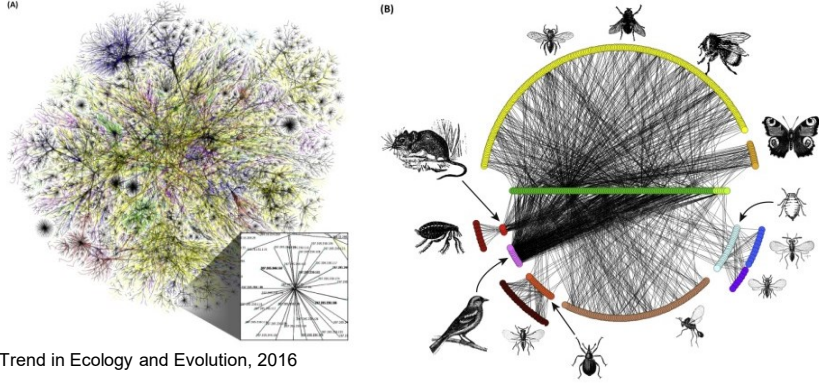

Institute of Geography | Transformation Metropolitaner Regionen | @PlacesLab | @blal\_adem

EUP - Session 5: Overview of methods for mapping and assessment of ecosystem services (ES)

# Guiding questions

- Which general approaches exist to assess ecosystem services (ES)?
  - What are ES indicators?
  - Which methods can be used to assess ES indicators?
  - What should we consider when assessing ES indicators in urban contexts?
- 
- **Problem analysis** (hand on)

# Complexity of nature

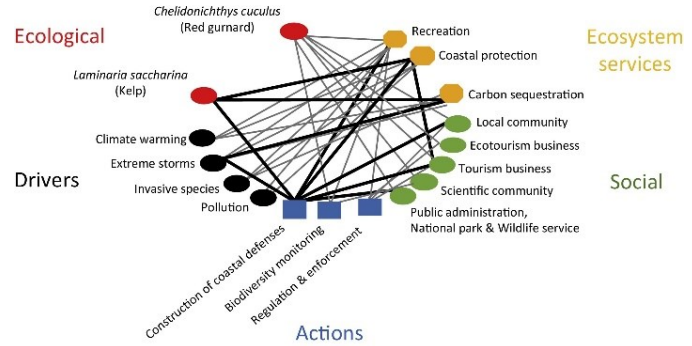

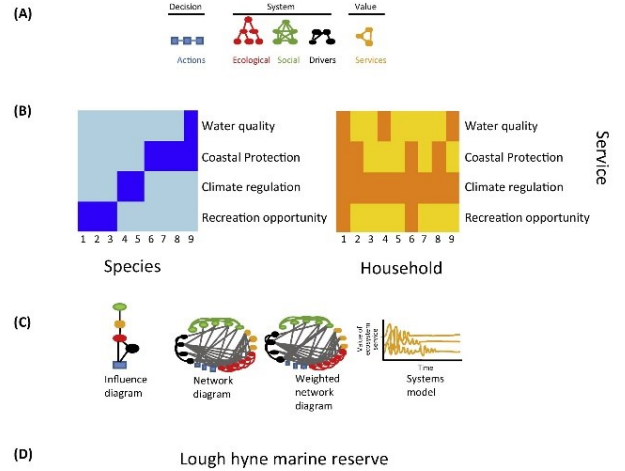

ESS Trend in Ecology and Evolution, 2016

**Food web network = trophic level + feeding relationships**

Martinez. 2020

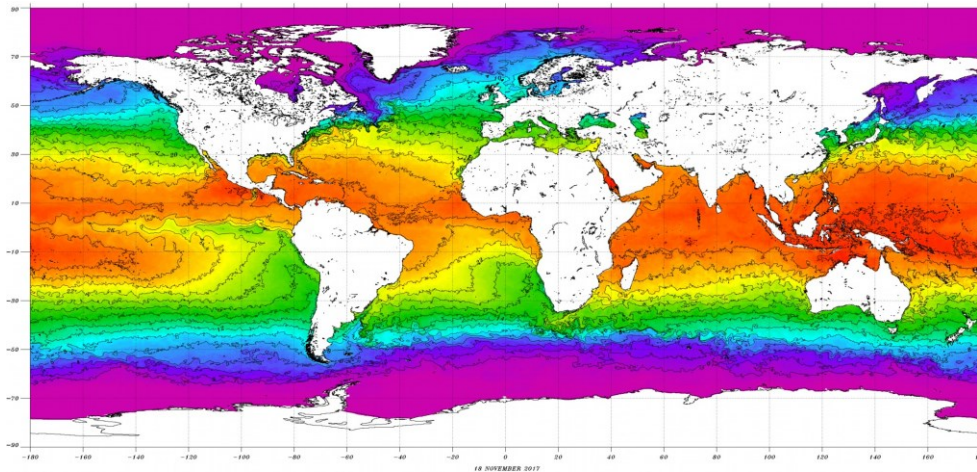

# Rationale for Indicators

- Sea surface temperature (°C)
- Macrobenthos as indicator species in rivers (name, number of)
- Nitric oxide (NO<sub>x</sub>) levels (ppm) or NO<sub>x</sub> per unit of GDP
- Trunk circumference (m)

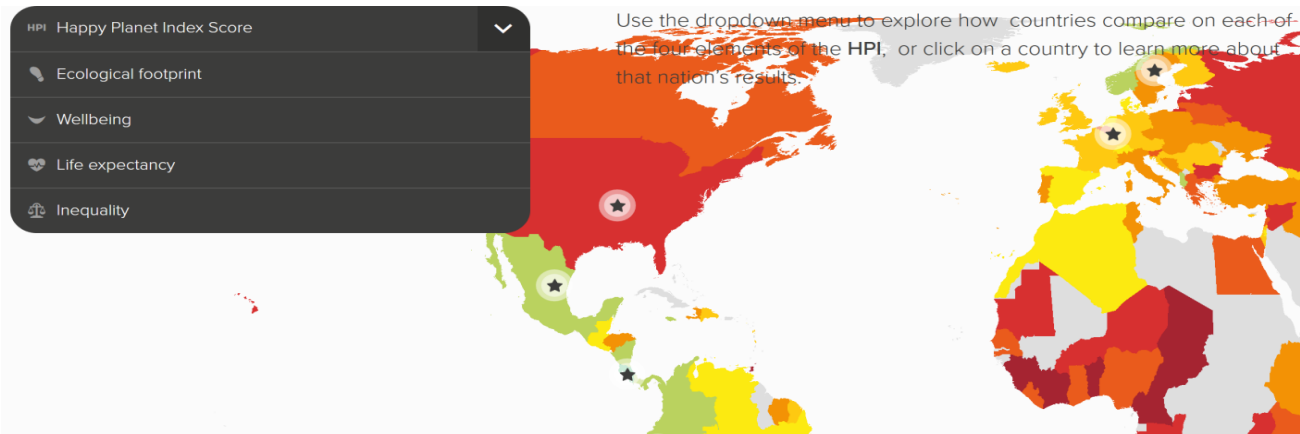

# General examples of environmental indicators

- Our environment is highly **complex and variable**
- **Monitor and measure** everything → not possible
- Indicators are a **practical and economic way** to track the state of the environment

# Other examples of indicators

- Economic (Gross Domestic Product, GDP)
- Social (Employment rate)
- Indices (Air Quality Index, Happiness Index)

# Definitions

“An environmental indicator is a numerical value that helps provide insight into the state of the environment or human health. Indicators are developed based on quantitative measurements or statistics of environmental condition that are tracked over time. Environmental indicators can be developed and used at a wide variety of geographic scales, from local to regional to national levels.” [\[1\]](#)

“A parameter or a value derived from parameters that describe the state of the environment and its impact on human beings, ecosystems and materials, the pressures on the environment, the driving forces and the responses steering that system. An indicator has gone through a selection and/or aggregation process to enable it to steer action.”

Ecosystem Services  
Volume 1, Issue 1, July 2012, Pages 26-30

Short communication

The indicator side of ecosystem services

Felix Müller Benjamin Burkhard

Müller & Burkhard (2012)

# Other examples of indicators

“information that efficiently **communicates the characteristics and trends of ecosystem services**, making it possible for policymakers to understand the condition, trends and rate of change in ecosystem services”

- **Interpretation** depends on data sets and proxy indicators, such as land cover and land use.
- **Methods:** Models (InVEST), GIS Mapping, Surveys

## Key definitions

**Measure (or measurement):** Actual measurement of a state, quantity or process derived from observations or monitoring. e.g. bird counts, total dissolved solids, biomass, runoff.

An **indicator** uses measures to communicate something of interest. They are purpose and audience specific.

**Metric:** a set of measurements or data collected and used to underpin each indicator.

An **index** comprises a number of measures combined in a particular way to increase their sensitivity, reliability or ease of communication e.g. Red List Index for birds shows changes in threat status over time obtained through a specific formula. Disaggregation and traceability are important.

**Ecosystem service indicators** are information that efficiently communicates the characteristics and trends of ecosystem services, making it possible for policymakers to understand the condition, trends and rate of change in ecosystem services.

Fort Barton, Palawan, Philippines © Mary Alison M Dalas Alas, WorldFish (2011)

# Other examples of indicators

“information that efficiently **communicates the characteristics and trends of ecosystem services**, making it possible for policymakers to understand the condition, trends and rate of change in ecosystem services”

- **Interpretation** depends on data sets and proxy indicators, such as land cover and land use.
- **Methods**: Models (InVEST), GIS Mapping, Surveys

## Key definitions

**Measure (or measurement)**: Actual measurement of a state, quantity or process derived from observations or monitoring. e.g. bird counts, total dissolved solids, biomass, runoff.

An **indicator** uses measures to communicate something of interest. They are purpose and audience specific.

**Metric**: a set of measurements or data collected and used to underpin each indicator.

An **index** comprises a number of measures combined in a particular way to increase their sensitivity, reliability or ease of communication e.g. Red List Index for birds shows changes in threat status over time obtained through a specific formula. Disaggregation and traceability are important.

**Ecosystem service indicators** are information that efficiently communicates the characteristics and trends of ecosystem services, making it possible for policymakers to understand the condition, trends and rate of change in ecosystem services.

- Wetland products: Papyrus and ree items, palms used to make palm wi

**ECOSYSTEMS AND SOME SERVICES THEY PROVIDE**

Different combinations of services are provided to human populations from the various types of ecosystems represented here. Their ability to deliver the services depends on complex biological, chemical, and physical interactions, which are in turn affected by human activities.

MOUNTAIN AND POLAR	INLAND WATER Rivers and other wetlands	CULTIVATED	COASTAL
Food Fiber Fresh water Erosion control Climate regulation Recreation and ecotourism Aesthetic values Spiritual values	Fresh water Food Pollution control Flood regulation Sediment retention and transport Disease regulation Nutrient cycling Recreation and ecotourism Aesthetic values	Food Fiber Fresh water Dyes Timber Pest regulation Biofuels Medicines Nutrient cycling Aesthetic values Cultural heritage	Food Fiber Timber Fuel Climate regulation Waste processing Nutrient cycling Storm and wave protection Recreation and ecotourism Aesthetic values

## Reindeer

Finland has a large population of semiwild reindeer, approximately 200 000 animals. Reindeer are herded in the reindeer management area, which covers more a third of the land area of Finland in the northern part of the country. Reindeer herding is a traditional livelihood of indigenous Saami people, but many Finns own reindeer as well.

Reindeer are herded mainly for meat. Other material products are pelts, skins, antlers and bones. The revenue of reindeer herding before taxes was 23.2 million euros in 2008. There were approximately 4 500 reindeer owners in 2013. Reindeer herds feed mainly on natural pastures such as lichen grounds on forested and alpine heathlands.

# DPSIR Framework

First proposed by the EEA.

“**Drivers, pressures, state, impact, response**” framework.

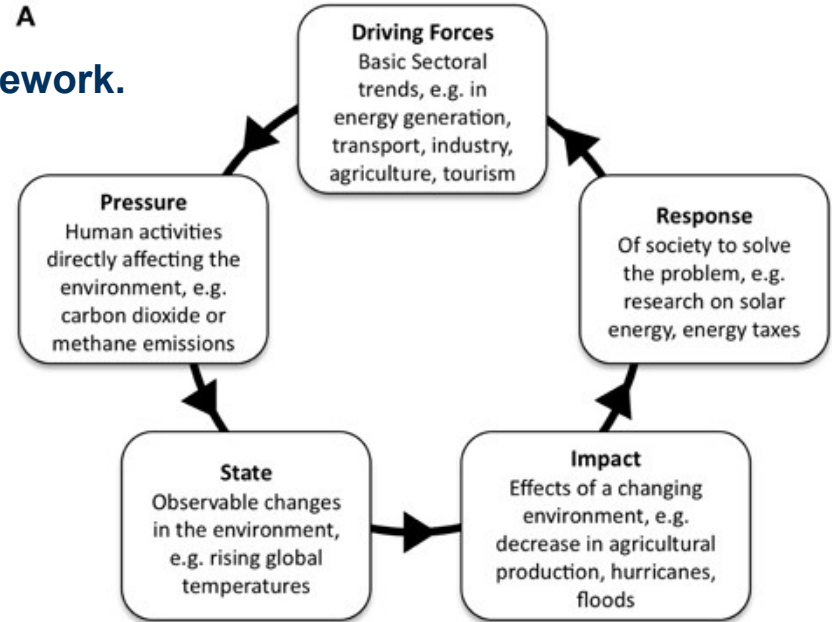

**Drivers and pressures**- indicators of the human activities and resulting pressures on the environment

**State and impact** indicators- cover the resulting conditions in the environment and the implications for the health of ecosystems and humans.

**Response** indicators- measure the reaction of human society to the environmental issue.

## Three key criteria:

1. scientific credibility policy/social relevance
2. practical monitoring
3. data requirements

# E.g. Developing indicators with DPSIR Concept

Urban Sprawl?

# ES Indicator Development Framework

## Step 1: Identify and consult stakeholders and target audience

- Questions to ask during this step:
- Who are the relevant stakeholders, and do they all need to be consulted?
  - What questions do the stakeholders want answers to regarding the ecosystem service of concern?
  - How will the stakeholders want to use the indicator(s)? e.g. for decision making, for reporting, for education.
  - Have the inputs, expectations and outputs of the indicator development process been clearly defined for the stakeholders?
  - How much ownership and decision making power are different stakeholders going to have over the choice of indicators?

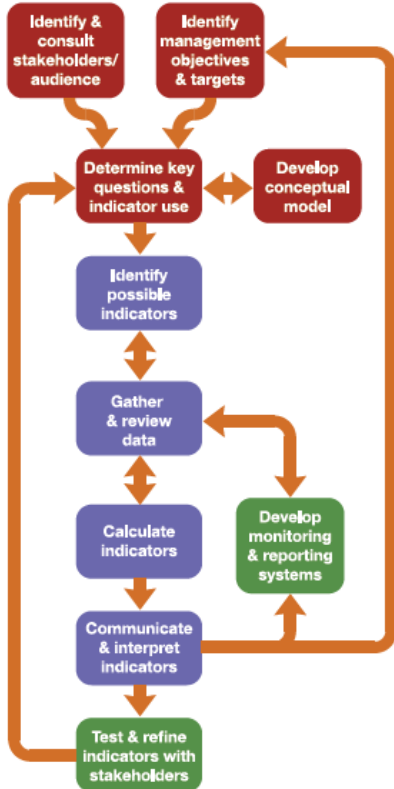

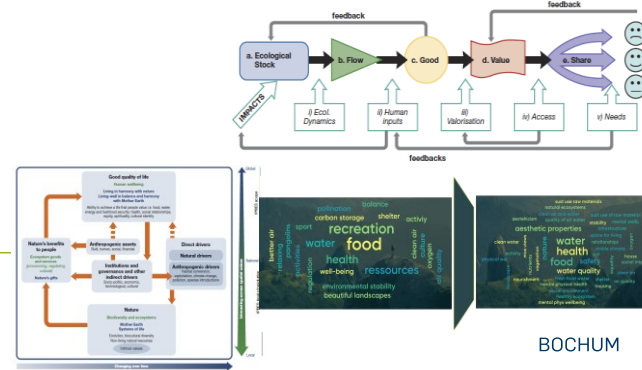

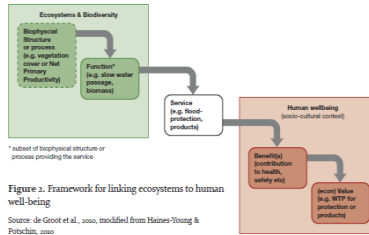

## Step 2: Identify ES related policy objectives and targets

## Step 3: Determine key questions and indicator use

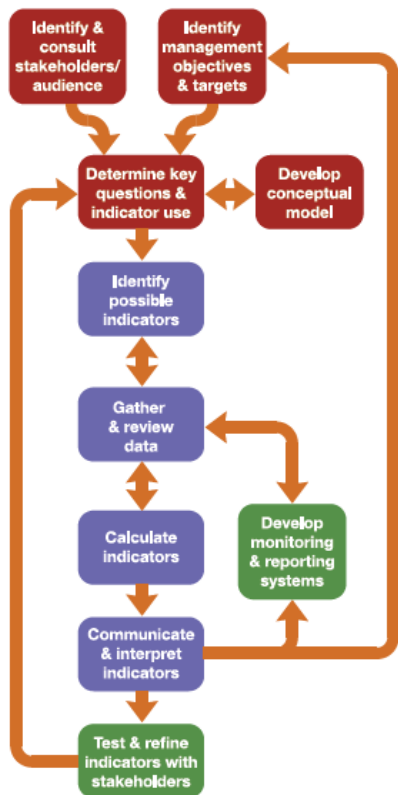

- Questions to ask during this step:
- What are the key questions that the intended user or audience have about ecosystem services?
  - Can the key questions be made more specific or focused?
  - How will the indicator be used?
  - Who will be using the indicator?
  - What level of education and familiarity with the subject does the intended audience already have?

- What ES does this habitat provide?
- Are the ES declining in our country?
- What are the main threats to the ES in the area?
- What is the status of the tourism numbers visiting the park?

## Step 4: Develop a conceptual model

# ES Indicator Development Framework

## Step 5: Identify possible indicators

### Questions to ask during this step:

- Are there existing indicators that can help to answer the key question(s)?
- How well does each of the potential indicators help to answer the key question(s)?
- Is the relationship between the measure used as an indicator and the indicator's purpose scientifically supported and easy for the user to understand?
- Are potential reasons for change in the value of the indicator well understood?
- How easily will it be understood by the intended users?
- Is there suitable data for each of the possible indicators?
- Can existing data be transformed into appropriate indicators?
- What are the resources available now and in the future for producing the possible indicators?
- Who will decide which indicators will be calculated?

## Step 6: Gather and review data

### Questions to ask during this step:

- Are the methods of data collection and analysis scientifically valid and defensible (considering the conceptual model)?
- Have all the steps for calculating the indicator been documented so that someone without prior experience of the indicator can follow them?

## Step 7: Calculating indicators

## Step 8: Communicate and interpret indicators

### Questions to ask during this step:

- Is the indicator presented appropriately to facilitate communication?
- Does the indicator communicate a story to the intended audience?
- What kind of media do I want to use to communicate the indicator storyline?
- Have I tailored the indicator outputs to the intended audiences?

## Step 9: Test & refine indicators with stakeholders

### Questions to ask during this step:

- Does the indicator answer the users' key question(s)?
- Is the indicator fit for purpose?
- Is the indicator understood in the intended manner by the users?
- What improvements could be made to the indicator and its presentation?

## Step 10: Develop monitoring and reporting systems

### Questions to ask during this step:

- Is there sufficient institutional technical capacity and resources to produce the indicator now and in the future?
- Is there a clear institutional responsibility for the continued production and reporting of the indicator?
- Do data collection and monitoring systems or agreements need to be strengthened?

# Other approaches

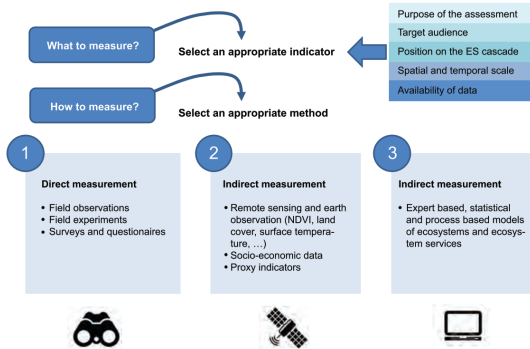

- Example of the ESMERALDA proposed framework

Stages of ES mapping assessment process	Description
<p>What kind of questions do stakeholders have?</p> 	<p><b>1. Domains and themes</b></p> <p>(a) Nature Conservation            (b) Climate, Water and Energy            (c) Marine and Maritime Policy            (d) Natural Risk            (e) Urban and Spatial Planning            (f) Green Infrastructure            (g) Agriculture and Forestry            (h) Business, Industry and Tourism            (i) Health</p>
<p>Identification of relevant stakeholders and network creation and involvement</p> 	<p><b>2. Categories of stakeholders</b></p> <p>(a) Competent authorities            (b) Other experts            (c) Business            (d) General Public</p> <p><b>3. Level of involvement</b></p> <p>(a) Inform            (b) Consult            (c) Involve            (d) Collaborate / Partnership            (e) Empower</p>
<p>Mapping and assessment process</p> 	<p><b>4a. Ecosystem types</b></p> <p>(a) Urban            (b) Cropland            (c) Grassland            (d) Woodland and forest            (e) Heathland and shrub            (f) Sparsely vegetated land            (g) Wetlands            (h) Rivers and lakes            (i) Marine inlets and transitional waters            (j) Coastal            (k) Shelf</p> <p><b>4b. <p>Dissemination and communication (D&amp;C)</p> 	<p><b>5. Target of the D&amp;C activities</b></p> <p>(a) Scientific publication            (b) D&amp;C to Competent Authorities            (c) D&amp;C to General Public</p>
<p>Implementation</p> 	<p><b>6. Increasing level of Impact</b></p> <p>(a) People aware of, understand and discuss ES            (b) Stakeholders focus on ES and articulate different positions            (c) Alternative choices based on ES mapping and assessment            (d) Plans &amp; policies consider ES mapping and assessment            (e) New policy and finance mechanism established</p>

# Overview of Indicators and Methods

## Biophysical

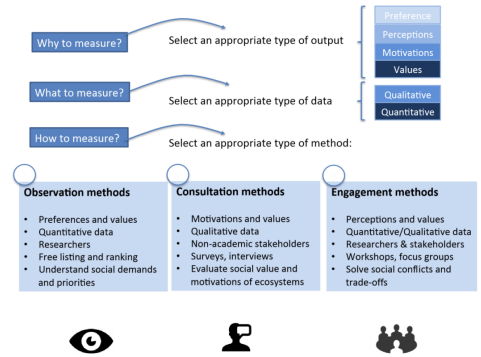

Biophysical quantification of ecosystem services

## Economic

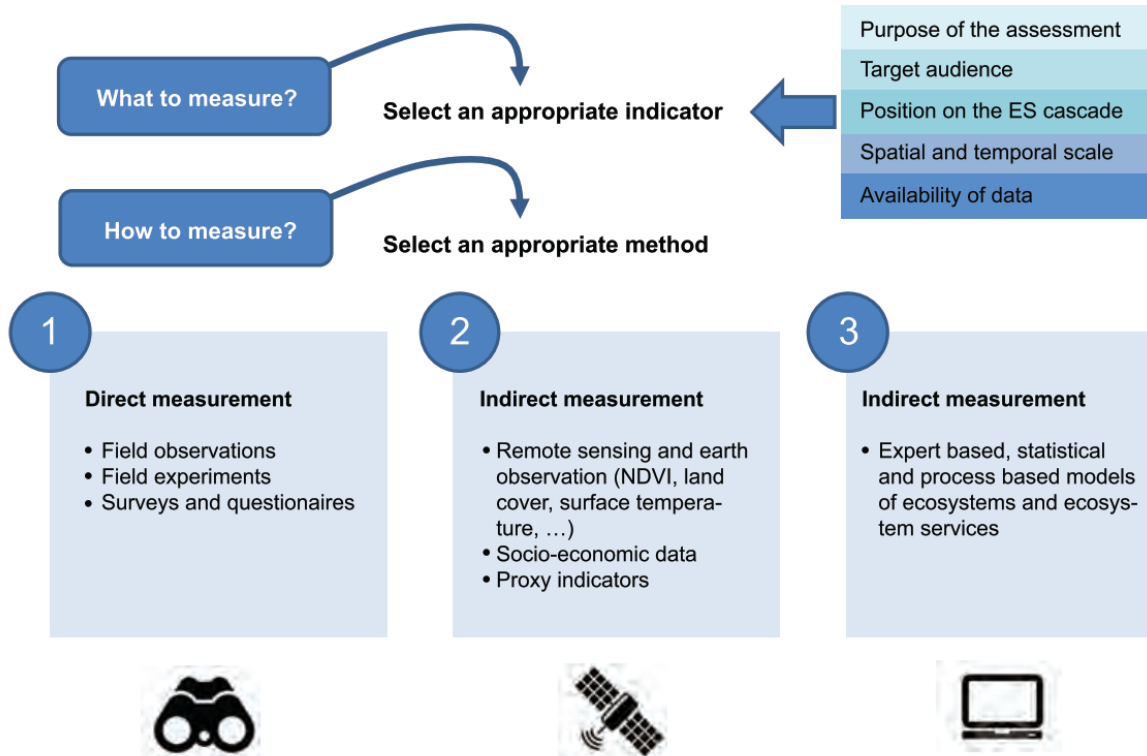

## Social

# Indicators and Methods: E.g. Biophysical

## Biophysical quantification of ecosystem services

# Same indicator, one ES?

**Different indicators** can be used to measure or indicate a **single ES**.

So **hundreds of indicators** available or possible.

The choice for an indicator depends on many factors including:

- ❖ purpose
- ❖ audience (pollination: scientist, farmer, policy officer)
- ❖ position on the ES cascade
- ❖ spatial and temporal scale considered (pollination vs. carbon)
- ❖ availability of data

# Examples of indicators

## Provisioning

- **Water for drinking:**
  - ❑ *Proportion of population using an improved drinking water source*

## Regulating

- **Climate regulation:**
  - ❑ *UHI Effect reduction by trees: Temperature reduction effect by tree cover in each land use multiplied by m<sup>2</sup> of plot trees cover in °C*

## Cultural

- **Recreation:**
  - ❑ *Green space supply: Percentage of green space of the total area of the city (%)*

# E.g. of indicators from the EU MAES project

Ecosystem services	Main terrestrial and freshwater ecosystem	Indicator for terrestrial and freshwater ecosystems	Indicator for marine ecosystems
Cultivated crops	Cropland	● Area and yields of food and feed crops	● Yield
Reared animals and their outputs	Cropland Cropland Grassland	● Livestock	● Landings ● Catch per unit effort (where applicable)
Wild plants, algae and their outputs	Forest	● Distribution of wild berries (modelling)	
Wild animals and their outputs	Forest	● Population sizes of species of interest	
Plants and algae from in-situ aquaculture			
Animals from in-situ aquaculture	Lakes and rivers	● Freshwater aquaculture production	
Water (Nutrition)	Lakes and rivers	● Water abstracted	
Biomass (Materials)	Cropland Forest	● Area and yield of fibre crops ● Timber production and consumption s	
Water (Materials)	Lakes and rivers	● Water abstracted	
Plant-based resources	Forest	● Total supply of water per forest area (t	
Animal-based resources	Forest	● Fuel wood statistics	
Animal-based energy			
(Mediation of waste, toxics and other nuisances)	Forest	● Area occupied by riparian forests ● Nitrogen and Sulphur removal (forests	
Mass stabilisation and control of erosion rates	Forest Cropland Grassland	● Soil erosion risk or erosion protection	
Buffering and attenuation of mass flows			
Hydrological cycle and water flow maintenance			
Flood protection	Wetlands	● Floodplains areas (and record of annual ● Area of wetlands located in flood risk	
Storm protection			
Ventilation and transpiration	Cropland Grassland	● Amount of biomass	
Pollination and seed dispersal	Cropland Grassland	● Pollination potential	

● available indicator to measure the condition of an ecosystem, or the quantity of an ecosystem service at a given CICES level for which harmonised, spatially-explicit data at European scale is available and which is easily understood by policy makers or non-technical audiences. Spatially-explicit data in this context refer to data that are at least available at the regional NUTS2 level or at a finer spatial resolution. CICES classifies ecosystem services at 4 hierarchical levels. Sometimes, it is more cost-effective to consider an assessment of ecosystem services at a higher CICES level than at class level, especially if aggregated indicators are available. Indicators that aggregate information at higher hierarchical CICES level can therefore also have a green label.

● available indicator to measure the condition of an ecosystem, or the quantity of an ecosystem service at a given CICES level but for which either harmonised, spatially-explicit data at European scale is unavailable or which is used more than once in an ecosystem assessment, which possibly results in different interpretations by the user. This is typically the case for indicators that are used to measure ecosystem condition, which are reused to assess particular ecosystem services. This colour also includes indicators that capture partially the ecosystem service assessed.

● available indicator to measure the condition of an ecosystem, or the quantity of an ecosystem service at a given CICES level but for which no harmonised, spatially-explicit data at European scale is available and which only provides information at aggregated level and requires additional clarification to non-technical audiences. This category includes indicators with limited usability for an ecosystem assessment due to either high data uncertainty or a limited conceptual understanding of how ecosystems deliver certain services or how ecosystem condition can be measured. The ability to convey information to end-users is limited and further refined and/or local level assessments should be used for verifying the information provided by this type of indicators.

● unknown availability of reliable data and/or unknown ability to convey information to the policy making and implementation processes.

# Question: Which ES do these indicators indicate?

- Soil field (water) capacity (%)
- Direct run-off (mm/yr.)
- Peak flow reduction downstream (%), return time (10) years
- Area of recent floodplains minus built-up settlement areas and transport space (ha)

Source: R.R. Homer

**Water regulation**

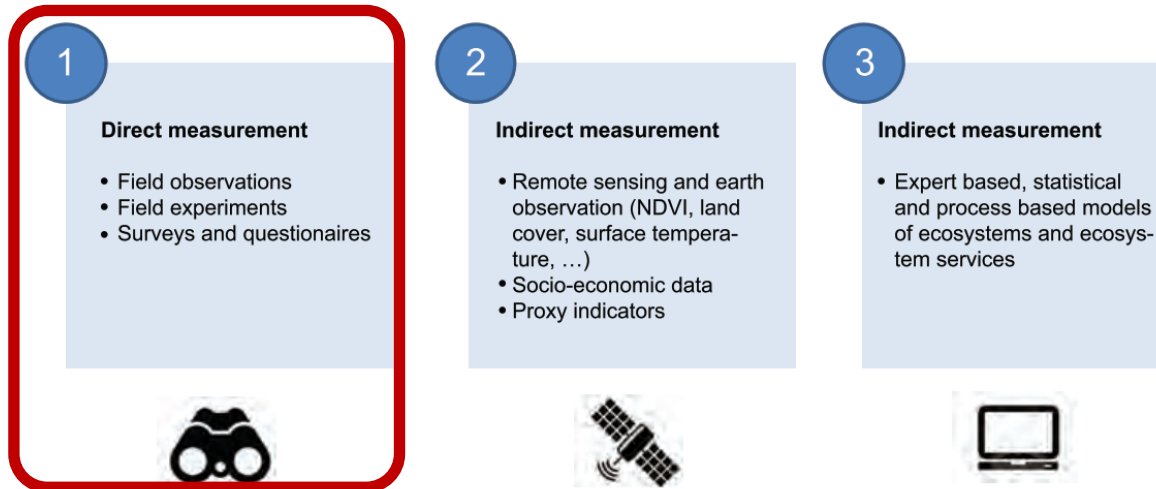

# Indicators and Methods: E.g. Biophysical

## Biophysical quantification of ecosystem services

**Most accurate**  
means to quantify  
ES.

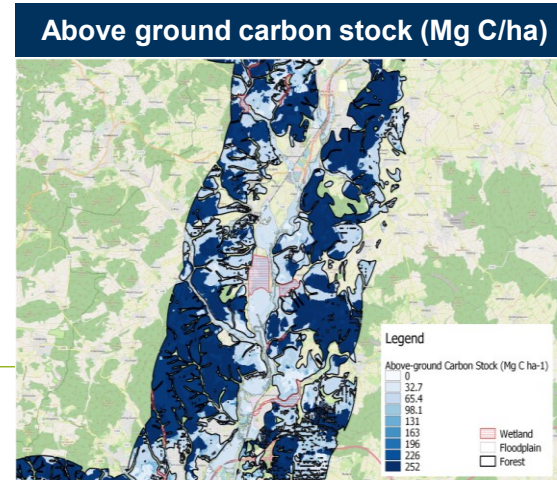

Time, money and  
**resource**  
**consuming.**  
Mostly suitable  
for **site level** or  
**local scale.**

# Methods: Models and Mapping ES

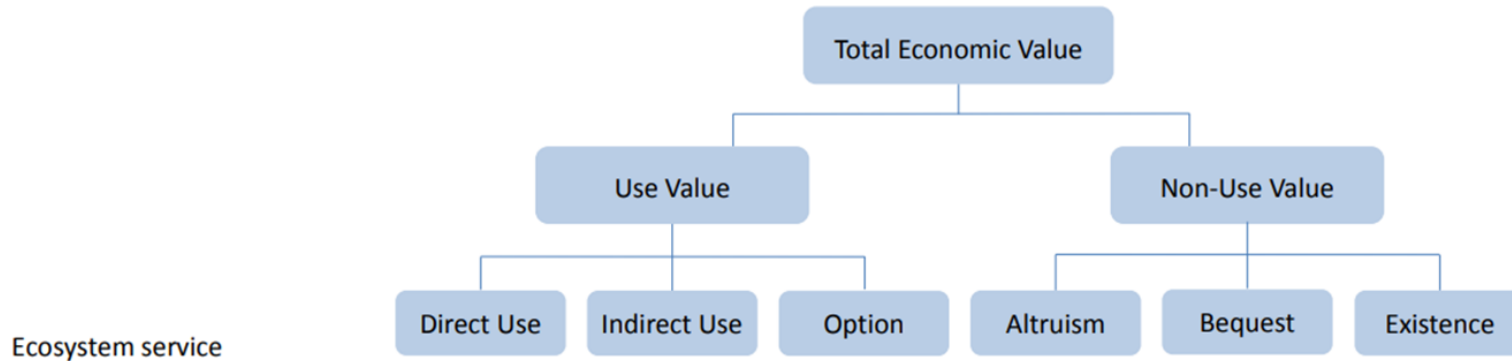

## Models

- Combine types of data
  - Measured (direct) data, i.e. precipitation, nitrogen loads
  - Background data, i.e. Elevation
  - Parameters, i.e. Water retention coefficients
  - Look-up tables

# ES valuation: Monetary valuation

## Ecosystem Services Valuation Database (ESVD)

The continued loss of ecosystems and biodiversity is endangering the prosperity of current and future generations (Dasgupta, 2021). To make better informed decisions about the trade-offs involved in ecosystem management, land-use change, or any activity affecting ecosystems and biodiversity, we need better information about the full importance of ecosystems to our wellbeing. The Ecosystem Services Valuation Database (ESVD) has been developed with the long-term goal of providing robust and easily accessible information on the economic benefits of ecosystems and biodiversity, and the costs of their loss, to support decision making regarding nature conservation, ecosystem restoration and sustainable land management.

The focus of the ESVD is to gather information on economic welfare values related to ecosystem services measured in monetary units. By communicating such values in monetary units, we provide recognisable information that can be used to internalise the importance of Nature in decision making.

The ESVD currently contains over 6,700 value records from over 950 studies distributed across all biomes, ecosystem services and geographic regions. Our repository of valuation studies contains over 5000 studies and the number is growing continuously so the number of value records in the ESVD will increase over time.

Do you want to do a project with us or read more on the ESVD, please [visit our info website](#) for more information on the background, the different ESVD applications as well as the latest projects.

### Terms of Use

We allow use for non-commercial, research and educational purposes aimed at supporting more sustainable ecosystem management and policy making.

Reports using the ESVD should be made publicly available and use correct citation (Foundation for Sustainable Development (2021). Ecosystem Services Valuation Database 1.0, [download date], <https://esvd.net>).

In no event will the Foundation for Sustainable Development, their affiliates, agents or collaborators be liable for any damages; including without limitation, direct or indirect, special or incidental, moral or consequential, arising in connection with your use of the ESVD, its information or derivatives of the ESVD.

### About the ESVD & Registration

To use the ESVD you can [register for a free account](#). By signing up, you are indicating agreement with the Terms of Use specified in the card to the right.

You can search the ESVD in the "Database" page using a set of drop-down lists and/or free text search. Here you can view your search results, generate summary statistics, and download data.

You can suggest a study to be added to the ESVD using the "Suggest a Study" page. Suggested studies will be added to the repository of valuation studies

# Indicators and Methods: E.g. Socio-cultural

# ES valuation: Non-monetary valuation

# Methods: Models and Mapping ES

Immaterial, socio-ecological benefits from nature (knowledge, spiritual, aesthetic)

- **Intangible---** How to measure?  
How to map?
- **Indicators (proxy):**
  - Visitors to a park
  - Pictures taken
  - Emotional association to places

Spatial distribution of urban nature (filled symbols) and Not Urban nature images (outline symbols)

# Methods: Models and Mapping ES

Immaterial, socio-ecological benefits from nature (knowledge, spiritual, aesthetic)

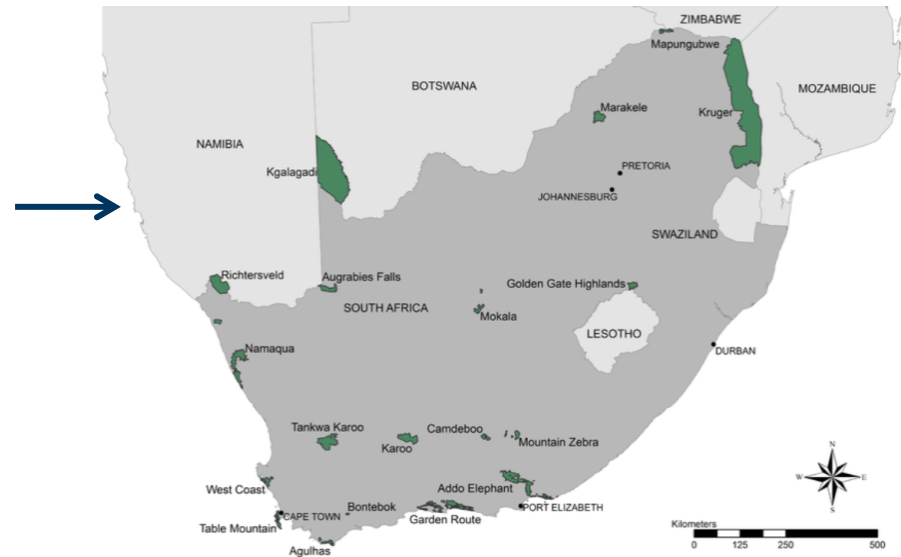

- **Intangible--- How to measure? How to map?**
- **Indicators (proxy):**
  - Visitors to a park
  - Pictures taken
  - Emotional association to places

Emotional association to places	
(Dis)service	Definition
Spiritual services	Sites of spiritual, religious, or other forms of exceptional personal meaning
Educational values	Sites that widen knowledge about plant and animal species
Inspiration	Sites that stimulate new thoughts, ideas or creative expressions
Aesthetic values	Sites of particular beauty
Social relations	Sites serving as meeting points with friends
Sense of place	Sites that foster a sense of authentic human attachment, in German language commonly epitomized as <i>Heimat</i> ("home")
Cultural heritage values	Sites relevant to local history and culture
Recreation and ecotourism	Sites used for recreational activities (walking, dog walking, horse riding, swimming, gathering wild foods, angling, hunting, etc.)
Unpleasantness	Sites that are neglected, abused, damaged, or unpleasant
Scariness	Sites that feel dangerous or threatening
Noisiness	Sites that are disturbingly noisy

# Methods: CES Surveys linked to maps

Survey statement	Indicator variable	Mean response ( $\pm$ SD)	Median response
<b>Aesthetic</b>			
Looking at big mammals	Big mammals	4.43 ( $\pm$ 0.72)	5—Strongly agree
Sitting, enjoying the view	View	4.38 ( $\pm$ 0.70)	4—Agree
Looking at birds	Birds	4.11 ( $\pm$ 0.94)	4—Agree
Looking at flowers	Flowers	3.72 ( $\pm$ 1.02)	4—Agree
Looking at reptiles	Reptiles	3.52 ( $\pm$ 1.09)	4—Agree
Trying to identify plants	Plants	3.38 ( $\pm$ 1.10)	3—Neutral
Looking for and or listening to frogs	Frogs	3.06 ( $\pm$ 1.13)	3—Neutral
<b>Cultural and heritage</b>			
The experience reminds me of my childhood	Childhood	3.48 ( $\pm$ 1.21)	4—Agree
It helps me to understand my culture and or history	Culture and history	3.31 ( $\pm$ 1.11)	3—Neutral
<b>Educational</b>			
Learning more about nature	Learning	4.25 ( $\pm$ 0.75)	4—Agree
Doing guided tours	Guided tours	3.18 ( $\pm$ 1.16)	3—Neutral

# Critical for indicator decision: DATA

How to choose the appropriate tier

- Process-understanding necessary?
- Rough overview enough?
- Explicit measures needed?
- Are data and resources available?

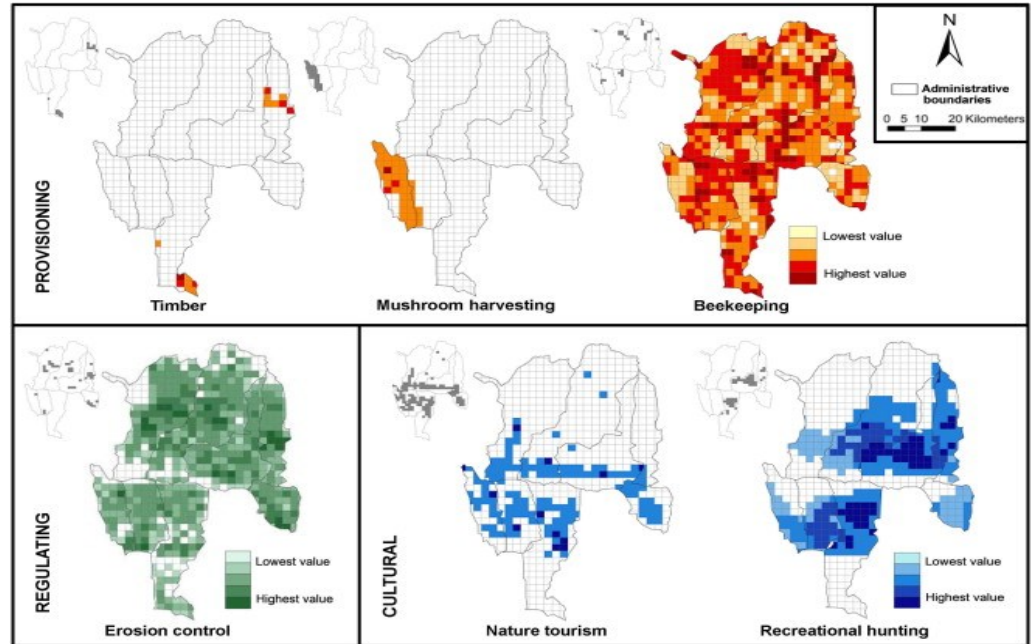

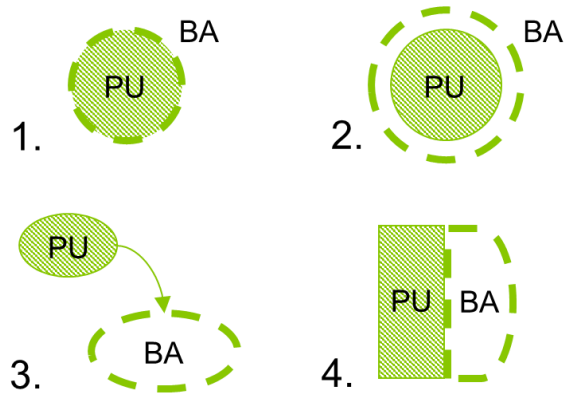

# Critical for indicator decision: DATA

From:

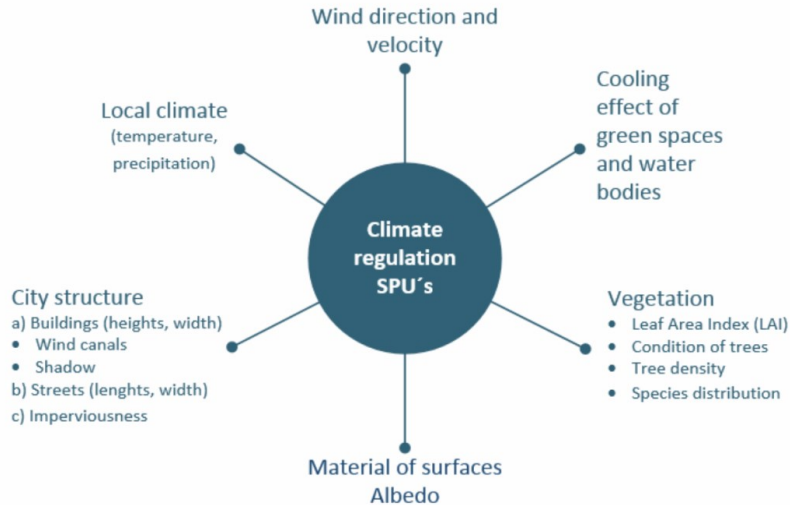

- Surveys
- Monitoring Data
- Satellite or Drone Data (NDVI)
- Look-up tables (coefficients, adapt)
- Laboratory Tests
- Formulas
- Proxy indicators
- Other ideas...?

# Methods: Service providing Units (SPUs)

Systematic quantification of the key components of nature that provide services for human wellbeing.

# Methods: Development of an Urban ES SPU

Climate regulation supply: high score of six climate regulating SPU's in Berlin, with high score indicating good climate regulating potential

- ~ Index for an ES (normalized)
- More precise results
- Overparameterization issues

# ESMERALDA

Welcome to ESMERALDA MAES Explorer, an online guidance tool created by the collaborative EU Horizon 2020 funded Coordination and Support Action for research and innovation "ESMERALDA - Enhancing ecosystem services mapping for policy and decision making".

This website provides directions on the process of mapping and assessment of ecosystem services as required by Action 5 of the EU Biodiversity Strategy to 2020. Action 5 foresees that the European Commission helps countries set up a knowledge base on ecosystems and ecosystem services and to use this knowledge in policy and decision-making at different levels of governance.

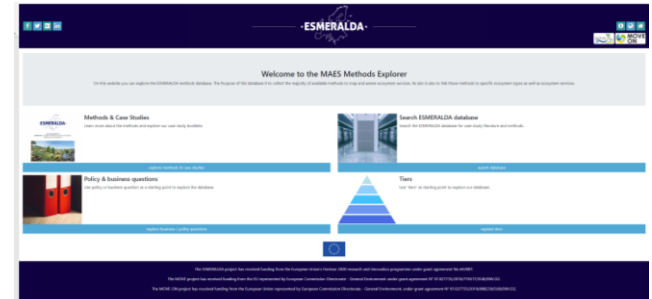

ESMERALDA worked closely together with the working group MAES on Mapping and Assessment of Ecosystems and their Services to develop guidance which is tailored to the member states of the EU.

Start exploring the guidance by clicking on one of the entry points below:

## Questions and Themes

- 1 What kind of questions do stakeholders have?
- 2 Identification of relevant stakeholders
- 3 Network creation and involvement of stakeholders
- 4 Mapping and assessment process
- 5 MAES case study applications
- 6 Dissemination and communication
- 7 Implementation

[Download PDF of full report.](#)

# Hands-on Environmental Urban Planning

**Task:** Analyze the Skarpnäck district and map existing **problems**, focusing in of the **4 key socio-environmental challenges:**

**CH 1: Urban heat island**

**CH 2: Loss of biodiversity**

**CH 3: Flooding risks**

**CH 4: Social cohesion & Quality of life**

**Abstract:** This paper investigates the contributions of an intensive educational workshop to advance students' understanding and skills for collaborative, scenario-based landscape planning. The research design involves a case study workshop with thirty international students and several regional experts as well as a multi-stage, in-process evaluation. The workshop resulted in six different alternative futures for the region of Cagliari, Italy, and a seventh combined version that was considered best by regional reviewers. The students' learning evaluation showed substantial advances in their relevant understanding and skills. Key aspects of the workshop pedagogy and the evaluation are discussed, and recommendations for future applications presented.

# Hands-on Environmental Urban Planning

**Each Team** prepares a **10 min presentation**, based on its **Problem Analysis** in the Skarpnäck district using the lens of the selected **socio-environmental challenges**

Imagine that you are presenting to an audience that knows nothing about your study/project, so try to **provide all necessary elements** so that they are able to follow and provide feedback

You may consider making **a joint presentation**: given that most of the background information is the same (e.g. Swedish Planning System, Stockholm City Plan, and Vision, Skarpnäck etc.)

# Thank You
